

Additional declaration to the sales contract for BMW M3 CSL

Tyre Information:

Special sports tyres have been developed for the M3 CSL. One focus in these tyres' development was on dry grip, which has been increased considerably compared to conventional tyres.

However this leads to considerable limitations when compared to conventional tyre properties including:

- The special tyre profile results in increased danger of aquaplaning on wet surfaces.
- Tyre grip drops considerably at low outside temperatures and low tyre operating temperatures. At outside temperatures of less than 7 degrees centigrade, it is essential that winter tyres (or regular compound tyres) are used.
- Due to higher tyre wear, the minimum tread depth may be reached at an earlier stage (depending on driving style) resulting in reduced tyre mileage.

If the car is used by persons other than yourself, you must also point out these limitations to these persons.

Should the above limitations not be acceptable to you, we recommend selecting option 792: M light alloy wheel Double Spoke 67, 19" polished and forged (as for M3).

I have read and understood the information:
